

CERMES has created a new option for applicants to the MSc in Natural Resource and Environmental Management (NAREM) programme. It is the Mixed Specialisation which allows students greater flexibility in choosing courses across our existing four specialisation tracks:

- Tropical Coastal and Marine Resource Management
- Climate Change
- Water Resources Management
- Land Management and Environmental Resilience

After completing the core courses, students in the mixed specialisation would have the flexibility to choose four specialisation courses from any of the above specialisation streams, taking a maximum of two courses from any single specialisation stream. Students will therefore have the latitude to choose at least one course from each of the four specialisations to complete their degree.

The **mixed** specialisation was developed to allow students to combine their interests in different fields and to expand opportunities for employment and further studies. It provides students with broader knowledge and skills requisite for the complex demands of natural resource and environmental management.

Graduates from this programme will be able to work or continue working in various sectors of the economy, or with several development agencies in the areas of natural resource and environmental management. They will also be able to pursue further studies in several areas related to this field.

The total number of credits required is the same as established for the existing CERMES MSc specialisations and obtained through successful completion of taught courses and a research project.
