A livelihoods analysis of the water taxi operators in the Grenadines

ALEXCIA LATONIA COOKE, ROBIN MAHON AND PATRICK McCONNEY
The natural resources of the the Grenadine Islands of Grenada and St. Vincent and the Grenadines area, including the many beaches, reefs and cays, especially the Tobago Cays Marine Park (TCMP) are the resource base for their water taxi operation. These resources form part of the water taxi operators’ natural assets according to the definition by the Department for International Development (DFID). Given the importance of the natural resources to the water taxi operators, their potential for environmental stewardship may be realized through the monitoring of the same yachts that they supply. They can ensure, possibly through co-management of the Park, that their natural assets are not undermined by a sector that is poorly regulated. The other livelihood assets are classified into the physical, social, human and financial. The vulnerability context and the livelihood strategies were also assessed. The results show that water taxi operators depend on fishing to supplement their livelihoods, both for subsistence and sale to yachts, especially the latter.

ACKNOWLEDGEMENTS

Thanks to the many water taxi operators for their cooperation and readiness to share their experiences, without whose help, this study would not have been a success.

To Sylvester Tannis, Casper Smith, Kim Bethel, Mr. Thomas Alexander, Wendell Rock, Patrick Forde and Jerome Ollivierre for their assistance in this study in their respective islands.

To Dominique Lizama and Bertha Simmons for sharing the load in the field.
1 INTRODUCTION

The Grenadine Islands are located between the two mainland states of Grenada and St. Vincent and the Grenadines (Figure 1.1). Their sustainable development has become an important theme in the Grenadines and is being promoted through the establishment of the Sustainable Grenadines Project (SGP) in 2002. The project recognizes that the people of the Grenadines are dependent on their marine and coastal environment and hence an integrated approach to its sustainable development is paramount. The SGP provides the basis for the Water Taxi Project (WTP) considering that the water taxi operators (WTops) are one of the primary users of the marine environment and are an important component of socio-economic well-being in the islands. The WTops provide a valuable service by transporting visitors, locals and goods throughout the Grenadines. They are also potential stewards for environmental protection. For these reasons, they were identified as a priority during participatory strategic planning in Phase 1 of the Sustainable Grenadines Project (CCA/CaMMP, 2002; CERMES, 2004).

Figure 1.1 Location of the Grenadine Islands
Adapted from Mahon et al. 2002
The WTP seeks to assist these ‘small-scale operators who are struggling to make a living’ (CEC₁, 2005: 4). ‘They operate small, open, outboard-powered boats commonly known as cigarettes. They are currently largely unregulated and the boats are often poorly equipped. The operators are seldom trained in the skills that are required to operate a passenger craft or a small business and many lack the necessary capacity to provide safe and efficient service’ (CEC₁, 2005: 4). For the WTops to fully engage in, and benefit from the tourism sector it will be necessary for them to upgrade their boats and practices to provide safe and dependable service.

There has been no research on the livelihood assets, strategies or the vulnerability of the WTops in the Grenadines. The Global Environment Facility – Small Grants Programme (GEF-SGP) proposal provides several reasons for such research including the fact the WTO are primary users of the marine environment with potentially dangerous practices such as improper garbage disposal and careless grounding and anchoring which cause damage to the marine environment (CEC₁, 2005: 4).

The WTops have taken a step in moving toward sustainability in that they have come together to form associations. These associations have undertaken a visioning exercise to determine where they want to go in the future (CERMES, 2004). This is an initial step in the direction of sustainable livelihoods according to the Department for International Development (DFID) since institutional support is important to sustainability (DFID, 1999).

The WTP is funded by the GEF-SGP, The European Union and The Lighthouse Foundation. The project was developed jointly by the Carriacou Environmental Committee (CEC) which is also the implementing agency, Counterpart Caribbean (CC), the Centre for Resource Management and Environmental Studies (CERMES), UWI, and the SGP. The WTP is being pursued under four major objectives with associated activities as outlined within its Planning-Inception Report (CEC², 2005). These objectives include environmental education, customer service training, safety at sea and organisational strengthening. Education plays a vital role in the conservation of the natural resources and building the capacity of the WTops as denoted by the overall and specific objectives of the WTP in Box 1.

Planning for WTops will require a livelihoods analysis to determine the assets and vulnerabilities of this group as well as the requirements for enhancement. This will inform the development of appropriate inputs that may enhance their livelihoods and also serve as a baseline for assessing changes due to the inputs. The project will focus on the livelihood assets and strategies as well as the evident and perceived stresses and shocks (vulnerability) that have affected or are likely to affect the WTops. The Sustainable Livelihoods Approach (SLA) (DFID, 1999) will be used and is discussed in the literature review. However the entire SLA process will not be undertaken in this project. The vulnerability and livelihood assets and strategies of the sustainable livelihoods framework will be utilised in assessing the WTops. Their livelihoods strategies will also be described and categorized depending on the complexity of the operators.

The aim of this project is to carry out a livelihoods analysis of the WTops in the Grenadine Islands. The specific objectives that will be pursued are:

- To estimate the number of WTops in the Grenadines.
- To determine the vulnerability context of the WTops.
- To determine the livelihood assets of the WTops.
- To determine the livelihood strategies of the WTops.
Box 1.1 Objectives of the Water Taxi Project

The objectives of the project are:

1. To strengthen the capacity of the WTops of the Grenadines Islands. It should be noted that the two water taxi associations mentioned in this proposal do not include all WTops in the Grenadine Islands but it is expected that all WTops in the area will be involved in this project and will receive the appropriate training. This is expected to encourage them to join the relevant associations.

2. To enable WTops to make a substantial contribution to the conservation of marine resources in the area through participating in co-management as responsible, knowledgeable users, thereby allowing them to become better stewards of the environment upon which their livelihoods depend.

3. To allow the WTops to pursue their livelihoods in a sustainable way by gaining an equitable share of the market.

The Specific Objectives and training activities within the project are:

1. Environmental Education
   - Green Boat Operation Training
   - Training in the management of the natural resources and environmental stewardship
   - Production and distribution of environmental education material

2. Customer Service Training
   - Customer service and attitude/self marketing/negotiation training
   - Self-marketing skills training
   - Training in negotiation skills

3. Safety at Sea
   - Acquisition of safety demonstration equipment
   - Safety equipment demonstration
   - Safety procedures training

4. Organisational strengthening
   - Production of WTAs website
   - Training of CEC and WTA leaders
   - Individual level record keeping training
   - Acquisition of office equipment and supplies

Adapted from the CEC¹, 2005 and CEC², 2005.

2 LITERATURE REVIEW

The Sustainable Livelihoods Approach (SLA) was developed by DFID, the development agency of the Government of the United Kingdom. DFID “supports policies and actions which promote
sustainable livelihoods” (DFID, 1997: 3). DFID has thus produced guidance sheets and several reports which detail the various aspects of the (SLA).

Sustainability is an important concept, which has been used over the years and especially since the United Nations Convention on Environment and Development in 1992. DFID has defined sustainability in a number of ways with respect to livelihoods. These include:

- Resilience in the face of external shocks and stresses
- Independence of external support (both economically and institutionally)
- Maintenance of long-term productivity of natural resources
- Avoidance of compromising livelihoods options of others

The SLA framework as devised by DFID (Figure 2.1) is one of several approaches to assessing livelihoods and has forged linkages with several of them. These other approaches include Participatory Development, Sector-wide Approaches, National Strategies for Sustainable Development and Integrated Rural Development. The SLA is thought to have built on the pitfalls of these approaches with the emphasis being people-centredness and poverty reduction. The SLA seeks to reduce poverty and ultimately to build up the human capital of the poor. Literacy is seen as a critical tool in achieving enhanced sustainable livelihoods, since it not only contributes to human capital but may also lead to the development and improvement of other assets (DFID, 2002).

The SLA has been applied in various circumstances across the world with lessons learnt from the process being of much importance for the improvement of the approach and to development projects (Ashley, 2000). A study on the livelihoods within the fishing community of Gouyave in Grenada revealed three livelihood strategies: combining specialization and multitasking, livelihood diversification and maintaining social safety nets (networking and sharing) (Grant, 2004). These are the types of outcomes that are yielded from the SLA and are integral to achieving sustainable livelihoods.

Knowledge of the various aspects of the livelihoods provides information that can be useful in identifying suitable 'entry points' for external support that are compatible with, and appropriate to, vulnerable people's survival strategies and priorities (Farrington et al., 1999). This knowledge can also inform policies at the level of government for appropriate intervention. Knowledge of the physical assets required by operators and consequently the provision of adequate facilities may contribute to the increased safety at the various government-owned docks.
3 METHODOLOGY

The study proceeded in two stages. The first was a preliminary survey used to establish an inventory of the number of WTops throughout the Grenadine Islands (Appendix 1). This was done by visiting each of the islands, recording all the WTops encountered until no more new operators were found. The data was entered and analysed using the Statistical Package for Social Sciences (SPSS). This information was used to produce a preliminary report on the number of operators along with general information on their operation. The preliminary work was conducted and compiled in conjunction with Dominique Lizama who investigated the environmental practices of operators within a ‘green boat’ study.

The second stage was a qualitative in-depth survey that assessed the various livelihood assets and strategies and the vulnerability context of WTops (Appendix 2). 19 persons from across the Grenadine Islands were interviewed. Four came from Bequia, five each from Union Island and Carriacou, three from Mayreau and two from Petite Martinique. The only operator from Canouan was unavailable for an interview. These operators were selected based on who operators and other community members thought were knowledgeable of the water taxi business and those who were willing to share their experiences. Respondents were also identified based on the years of experience in water taxiing as indicated in the preliminary survey. The choice of operators was also based on the level of interaction and the information that operators shared in the preliminary survey.

A major limitation was that the time-frame limited the study to the analysis of the livelihood assets, strategies and the vulnerability context of the WTops as opposed to the full application of the SLA. The transforming structures and processes which relate to issues of governance were
not assessed. These however may influence the livelihood outcomes of the operators which include income, reduction of vulnerability and more sustainable use of the natural resource base. The time-frame also limited the number of WTops interviewed for the in-depth survey which may have led to a less representative depiction of the livelihoods of the operators given their diversity.

4 RESULTS

4.1 Initial survey of water taxi operators

The group is mostly male oriented with an initial survey revealing that from a total of 100 water taxi boat owners, only three were women. These three women who assisted in the operation of the water taxi along with their male partners. The respondents in this survey ranged in age from 21 to 45 with experience in water taxiing ranging from one year to more than 30 years. WTops in the Grenadines have various motivations for becoming such. They posited reasons such as mere coincidence to the need to survive. Many of them, having been raised around the sea find it inconceivable to move away from this familiar environment. Others were involved in the tourism industry in hotels prior to water taxiing and having a love for interacting with tourists, saw this as an opportunity to do so whilst being self-employed.

One hundred water taxi owners were found in this survey with some people owning more than one boat. The number of boats engaged in water taxi operations was 118. Of the 100 boat owners, 97 were male and 3 were females. Union Island had the largest percentage of water taxis (36.4%) with the majority of these operating from Clifton. Union Island was followed by Carriacou and then Bequia with 27.1% and 15.3% of the water taxis respectively (Figure 4.1).

![Figure 4.1 Distribution of the Number of Boat Owners by Island](image)

There is some variation in each island, in terms of the sites that are most utilised as home bases for docking (Figure 4.2). In Carriacou, the majority of the WTops dock in Windward and Hillsborough. In Bequia a large majority of them dock in Admiralty Bay while in Mayreau, Saline Bay is most utilised.

Overall there were approximately 242 persons involved in water taxiing as owners and operators based on the survey. The number of operators is larger than the number of boat owners because at different times, there are various operators who may operate a given boat. The water taxis
were operated both solely (by the owner or otherwise) or by several operators. Figure 4.3 shows the distribution of boats operated by the respective number of persons.

**Figure 4.2 Distribution of Boats by Dock Location in the Grenadines**

There were 58 persons who are members of either the Southern Grenadines Water Taxi Association or the Carriacou and Petite Martinique Water Taxi Association. There were 26 persons who were not members of either. Union Island had the highest number of registered WTops with 26 persons. Petite Martinique had the lowest number of registered WTops, however this represented more than half the total number of persons who are WTops in Petite Martinique. Bequia was excluded from this analysis because there is no water taxi association there (Figure 4.4). There were 33 persons who are registered members of the Southern Grenadines Water Taxi association. There were 25 persons who are members of the Carriacou and Petite Martinique water taxi association.
The sizes of the boats range from 3.6 m to 15 m with the distribution of these boats being normally distributed around a mean size of 5.9 m. The most common boat length was 5.5 m (18 ft). Extreme outliers were seen in Carriacou which tended to have larger sized boats than any of the other islands. The relationship between the horsepower and the mean length of the boats was
a positive one, whereby an increase in the mean length of the boat showed a corresponding increase in horsepower. This is expected because a larger boat would require greater power to drive it. 31% of the boats carried engines with a horsepower of 40 while 18% had a horsepower of 85% (Figure 4.5).

The majority of the boats were open, partially-decked, locally called cigarette boats which accounted for 81.4% of the 118 boats surveyed (Figure 4.6). This type was followed by pirogues and flat sterns which were much less popular (9.3% and 6.8% respectively). The majority of the cigarette boats were made of wood and fiberglass (Figure 4.6).

![Figure 4.5: Bar chart showing the distribution of the horsepower of engines](image)

![Figure 4.6 Types of water taxis in the Grenadines](image)
The total number of boats with one engine was one hundred and eleven (111) and the total number of boats with two engines was seven (7). Union Island had the highest number of boats with one engine (42 engines), followed by Carriacou (27 engines) (Figure 4.7).

![Bar chart showing the number of engines per boat by island](image1)

**Figure 4.7** Bar chart showing the number of engines per boat by island

Of the total one hundred and eighteen boats, Yamaha accounts for 90% of the engines (Figure 4.8). The second most common engine was Mercury with 3% while only a few operators used other engine brands including Evinrude, Johnson, General Motors, Honda, Mariner and Perkins Diesel.

![Bar chart showing the distribution of engine brands](image2)

**Figure 4.8** Bar chart showing the distribution of engine brands
4.2 Sustainable livelihoods survey

4.2.1 Livelihood assets

Human capital

Human Capital is defined as the ‘the skills, knowledge, ability to labour and good health that together enable people to pursue different livelihood strategies and achieve their livelihood objectives. At a household level human capital is a factor of the amount and quality of labour available; this varies according to household size, skill levels, leadership potential and health status’ (DFID, 1999: 7).

Household size varied among the operators with some of them living alone, some with their immediate family members and others within an extended family arrangement. Those who live alone may nonetheless have dependents on the same island, throughout the Grenadines and farther away (Appendix 3). Several of the operators have children and partners in North America, whom they support on a regular basis.

Few operators incur high costs from ill-health in their household. This is not only important to their ability to provide adequately for their household but also to the well-being of their operation. The good health of their families means that operators have to spend less money on doctor’s bills and they do not have to take days off to attend to sick family members. One operator from PM stated that ‘the people here are healthy because we eat mostly seafood and ground provisions’. This was supported by one from Union Island who said ‘I do not go the doctor because I take care of myself; what you put in you get out’.

WTops generally have the support of their partners and relatives with whom they share their home. In most cases, they said that they were assisted with the various types of bills to be paid around the house. There were not however many operators who had family members within or from outside their household involved in their operation. The type of involvement was in the form of providing business for the operator. This was the case for example with one WTO who receives business from his uncle who runs a guesthouse and requires his service in transporting guests. Another also benefits from a similar arrangement whereby his mother solicits customers for him while selling on the beach. From the initial survey, it was recognized that several members of the same family were WTops. In several instances there were brothers and cousins involved in water taxiing, whether from the same island or across the Grenadines.

A significant proportion of the operators have not had a secondary education. Many of those who had did not capitalize on the opportunity as they became involved in various delinquent activities including drug abuse. Those who completed their secondary education, like the current President of the CPMWTA, are better able to share information with respect to the environment with their customers and with those that they may teach about water taxiing. Some of the skills required for water taxiing are not necessarily taught in the classroom, but may be learned social behaviour, including courtesy, good hygiene and honesty. ‘Education can take place outside the classroom’ is the position of an operator from Bequia who was taught to read by a woman from the church. Local knowledge is also an important component of the knowledge possessed by WTops. This is especially true with respect to boat handling skills and the safe routes to travel. Operators cited family members as the source of this knowledge and although they considered themselves self-taught, it is likely that they would have observed family and friends who were involved in various boating activities.
There are some skills however which must be certified where people are involved especially international tourists. Many of the operators said that they have no formal training in life-saving with many of them claiming to be self-taught. This is an important issue given the fact that when WTOPs take customers on day-trips, the customers may be in the water at some point and there is therefore the possibility of them getting into life-threatening situations that would require life-saving skills. One operator shared an experience whereby he went out to the Tobago Cays Marine Park (TCMP) on a snorkeling trip with visitors who claimed to be good swimmers but on seeing a barracuda one of them panicked. He was without a second person on-board at the time and because he could not anchor, he had a difficult time in trying to handle the boat and save the woman at the same time. This shows also that it is important to have more than one person on board to assist, especially with a large group.

The fact that many operators do not have a secondary education dictates a need for training especially with respect to environmental issues. The level of detail and type of delivery must however be tailored to such a group. This is the type of ‘entry point’ that is being sought by this livelihood analysis.

Social capital

Social capital is defined as the ‘the social resources upon which people draw in pursuit of their livelihood objectives. These are developed through networks and connectedness, membership of more formalized groups and relationships of trust, reciprocity and exchanges that facilitate cooperation’ (DFID, 1999: 9).

There is a strong social network in the Grenadines wherein many of the operators have relatives within their community, elsewhere on the island on which they live and throughout the Grenadines as a whole (Appendix 4). There were strong family ties for example between Mayreau and Union Island which were discovered in the preliminary survey. Despite this integration throughout the Grenadines, many operators said that their relatives would not be able to provide assistance to them. In many cases the operators stated that they were independent and did not have to rely on relatives while others conceded that their relatives simply did not have the ability to help. ‘Everybody is struggling to make a living’ said one operator.

Although there was a general lack of WTOPs involved in community groups, operators seemed to be well integrated into their communities, providing assistance to community members in various ways. They are involved in clean-up campaigns and are often willing to ‘do anything just to help out’ as one said. This sentiment was echoed by many of the operators. Some operators stated that because they know the locals that they transport, and some may even be relatives, they find it hard to charge them anything other than ‘gas change’. The notion that the neighbour’s child is also the responsibility of the community or village is still evidenced by the actions of one WTO who buys books for the less fortunate children and seeks out those children who have not been attending school.

Based on the preliminary survey, disregarding the 18 WTOPs from Bequia in this analysis since there is no association there, 61% of the WTOPs belonged to water taxi associations. This is seen as a positive step in building the capacity of WTOPs, as such a group may contribute to the enhancement of the social and human capital of the operators.
Members cited various reasons for membership of such an association including the fact that they were encouraged to join and thought it would be a good thing. More specific reasons such as the improved professionalism and organisation among operators were given by some. There is also the belief that the associations can represent them collectively to achieve cooperation between the operators and tourism sector, especially when the objective of a maximum level of safety and comfort for visitors is regulated by the associations and achieved by operators. One WTO hopes to see ‘improved communication among operators which could ensure greater safety at sea’.

Natural capital

Natural capital refers to ‘the natural resource stocks from which resource flows and services (e.g. nutrient cycling, erosion protection) useful for livelihoods are derived. There is a wide variation in the resources that make up natural capital, from intangible public goods such as the atmosphere and biodiversity to divisible assets used directly for production’ (DFID 1999: 11).

WTop utilise the many beaches and cays throughout the Grenadines as natural capital for their businesses (Table 4.1). Some operators have pre-packaged various activities to include day-trips with stopovers along the way at the various islands (Box 4.1).

A diversity of activities is promoted in these packages including snorkeling, swimming, bird watching and diving around the cays and wrecks. On request, the trip may include lunch which the operators may prepare on the beach; barbeque-style or they may prepare sandwiches. This is all taken into consideration when a price is cited to the customer. One operator from Union Island has established a business which entails transporting customers to his restaurant in
Chatham Bay from hotels or from their yachts. He has been able to secure business from international yachting companies the Moorings and Sunsail. WTops have suggested that it is time that they benefit more from the many cruise ships that come to the area. They argue that they receive little business and in the case of Mayreau it is only to transport visitors from Saline Bay to Salt Whistle Bay.

The TCMP is one of the most popular sites for day trips and for soliciting business from yachts. Goods sold to the yachts may include bread, fruit and vegetables, gasoline and t-shirts. One operator from Bequia has been supplying yachts for over thirty years with these types of items. He commences his operation at 6:00 a.m. every morning going from yacht to yacht with his goods. He bakes the bread and grows his own limes for sale. He is therefore the first person to recognize if an unoccupied yacht has been vandalized and reports this to the police. Given their mobility and presence, WTops have the capacity to help ensure that the law is enforced throughout the Grenadines.

Locals require transport from one island to another and may also make the occasional excursion. Given the irregularity of a formal ferry service between the islands of Grenada and St. Vincent and the Grenadines, WTops play an important role in providing this service. Some people go from Carriacou, for example, to take the mail boat from Union Island. When they return from their trip they also require transportation back to Carriacou with their goods.

WTops travel all across the Grenadines but there is a tendency for operators from Grenada’s Grenadine Islands to frequent the more southerly sites like Sandy Island, White Island, Punaise, Mopion and the various cays around the Carriacou and Petite Martinique. Although these operators do go to the Tobago Cays, it appears to be a less frequent occurrence. WTops from the Grenada grenadines experience no difficulty in crossing the boundary between jurisdictions to visit the various attractions. One operator said that it is inconvenient to stop while doing his job to seek clearance from the immigration department. One operator from Carriacou shared that ‘the authorities would be overwhelmed on a daily basis’ because of the frequency with which he and other operators go to Union Island. He also shared that he is known to be a Grenadian and when he is in Union Island, he encounters no problems from the authorities.

Physical capital

Physical capital ‘comprises the basic infrastructure and producer goods needed to support livelihoods. Infrastructure consists of changes to the physical environment that help people to meet their basic needs and to be more productive whereas producer goods are the tools and equipment that people use to function more productively (DFID, 1999: 13).

The physical capital of the WTops refers to the facilities that they use to carry out their operations. WTops beach and stern anchor at the various beaches and cays mainly because of the lack of sufficient moorings or total absence in some places. They drop their anchor in the near shore area and further secure their boat by tying the bow to an object on the beach.

At the various islands, they use the jetties provided by the governments along with privately owned jetties, for example, those at Lambi’s Guesthouse in Clifton, Union Island and Frangipani’s in Bequia.

The government-owned jetties have been deemed appropriate generally but a few of them were cited as being in need of repair or improvement. These include the Ashton jetty (Figure 4.9) which has a gaping hole at its end and the Clifton jetty which does not have fenders for small boats. A few of the private jetties are also thought to be in a state of disrepair and are thus hazardous to those who utilise them (Figure 4.10). There are numerous jetties around Admiralty Bay, so that there was no concern as to inadequacy there. WTops in Bequia also beach anchor for convenience.

Operators usually pull up their boats on the beach (Figure 4.11) or take them to their homes. The fisheries complex in Clifton, Union Island (Figure 4.12) serves as a haul-up site for those who
mainly operate from Clifton. During storm events, operators pull their boats as far inland as possible to reduce damage to them. The Ashton WTops have developed their wharf area by building it up on the discarded conch shells and this serves as a drop-off area for passengers especially when the small jetty is in use (Figure 4.13). This shows a level of pro-activeness on the part of the Ashton operators, seeing the need for the infrastructure although lacking the legal authority to create such a structure.

The Public Relations Officer for the SGWTA and Community Development Officer for the Grenadines, who is also a WTop, highlighted that there is a general lack of moorings throughout the Grenadines and especially in the TCMP, which WTops and yachts frequent on a daily basis. He sees moorings as very important infrastructure for the protection of the natural environment, especially after visiting the SMMA in St. Lucia and seeing the mooring system there.
Physical capital also extends to boat ownership and the type of equipment that WTops carry on-board. From the initial study, there was an estimated 100 boat taxi owners with an estimated 118 boats. A few of them are successful enough to own more than one boat. There were thirteen such boat taxi owners from Bequia (2), Mayreau (2) Union Island (3) and Carriacou (6). The preliminary survey revealed that 85% of the boats were owner-operated.

Boats may be built by WTops or purchased either within the Grenadines or from as far as the United States of America. There are boat builders throughout the Grenadines with Bequia, Union Island, Carriacou and Petite Martinique cited as places from which boats were both purchased and custom built. Many of the operators were able to purchase their boats from their savings, with a few of them gaining assistance through loans. An operator from Carriacou stated that he was able to build his boat ‘piece by piece’ as he obtained the funds. A WTO from Union Island is also a boat builder and was recently able to build his own boat after using someone else’s boat to carry out his operation. Many operators use the beach to both build and maintain their boats (Figures 4.14 and 4.15).

Other physical capital includes the emergency equipment and supplies that the WTops carry on-board. WTops generally possessed anchor lines, tools for repair at sea, water, lights and in most cases, life jackets. Many operators did not possess day and night time flares and first aid kits. These are important safety items, especially the flares. Although the WTops usually have life jackets, passengers are seldom asked to wear them. This diminishes the value of this investment, particularly given the small size of the boats, the speed at which they travel and the minimal skills-level of the operators in life saving. Other pieces of equipment may include steering wheels, cables, and a Global Positioning System (GPS), which is owned by the most established WTO from Carriacou.

Figure 4.14 Boat building area in Windward, Carriacou

Figure 4.15 Boat repairs on the beach in Petite Martinique
WTops vary with respect to their personal physical assets. About equal proportions own their home, rent their home, and reside on family property. Many of the homes are of concrete with only a few being a combination of wood and wall. The ability to own their own land and home was not uniform across the entire group. Some have been able to own their own home and land solely through water taxiing, while others have had to depend on other livelihood activities to achieve this.

Access to basic amenities was good, with all the operators having electricity and piped water that is collected in tanks from the roofs of their homes. The majority have indoor plumbing with a few having outdoor toilet facilities.

The availability of land for farming was definitely not an issue, however, ownership was unclear. Most of the operators are involved in planting crops and rearing animals. This activity was mostly for their subsistence, however, with the main crops planted being corn, tomatoes, watermelon, lettuce and peas. Many operators cited time as a major factor that prevents them from farming. The lack of sufficient rainfall was also posited as another reason.

Fuel stations are neither common in the Grenadines nor easily accessible by boats and thus, WTops carry their tanks on land to get their fuel. Operators from the Southern Grenadines often utilise the only fuel station accessible to boats, located on the jetty in Petite Martinique (Figure 4.16).

This allows for direct filling of tanks, but is inconvenient for those who must travel from Union Island. One operator from Mayreau goes to Union Island daily to get fuel. Operators from Union Island go to both Petite Martinique and Canouan.

Financial capital

Financial capital ‘denotes the financial resources that people use to achieve their livelihood objectives. The definition used here is not economically robust in that it includes flows as well as stocks and it can contribute to consumption as well as production. However, it has been adopted to try to capture an important livelihood building block, namely the availability of cash or equivalent, which enables people to adopt different livelihood strategies’ (DFID, 1999: 15).

Operators either buy or build their boats along with the necessary equipment from their savings. WTops were able to secure loans from the bank to cover either the boat or the engine and in some cases, both. The average boat costs US$5,000 (US$800 to $29,000) while the average engine costs US$6,000.00 (US$600 to $15,000) (Appendix 5). WTops strongly believe that
saving money is important given the certainty of very little business in the low tourist season. There are some operators who prefer to save their money at the credit union. Others keep their cash at home and may even ‘bury it to keep it safe’ as one operator put it. The ability to save depends however on the amount of business that is secured against the various expenses that they must incur. One operator drew the analogy that ‘a boat is like a sinking ship, the more money you pour into, the heavier it gets and the further it sinks’. This is based on his experience as a WTO with the constant maintenance of the engine and the bi-annual refurbishment of the boat.

The major daily operating costs relate to the gasoline and oil consumed for the water taxi operation. The cost of preparing food for customers when requested is incurred by some operators. Few operators could give an accurate account of how much they spend. Many could however estimate the cost of gasoline and oil for daily operation and in some cases for a trip to the Tobago Cays (Appendix 6). According to one operator from Carriacou, his boat which is 6.5 m long uses up to 75 litres of gas per day costing up to US$60.00 along with the four bottles of oil which cost US$5.00/bottle.

Some operators drive around ‘hustling’ for business opportunities and are therefore increasing operation costs. Some stated that they go for days without getting any business. The level of organisation of the operators can be beneficial especially if operators wish to capitalise on the tourism industry. The organisation of the operators from a base on each island would also have a similar effect is reducing operation costs. This organisation may take the form of a rotation system such as that in operation at the Soufriere Marine Management Area in St. Lucia as reported by a WTO who went to the area on a one-week study attachment from the SGP.

The majority of the repairs to engines are carried out in mechanic shops across the Grenadines. Operators, especially from Bequia, may take their boats to St. Vincent for maintenance and repairs. The range of repairs and their associated costs vary considerably depending on the severity of damage to the boat or the engine (Appendix 7). Most WTops refurbish their boats yearly by painting and re-fiber-glassing. One operator contended however that if the engine and the boat are well taken care of, there will be less wear and tear and therefore lower maintenance costs. He said ‘it depends on how you take care of you boat’. This sentiment was echoed by every operator. An operator from Union Island, for example, has his boat serviced in Ashton every six months at a cost of US $260.00 each time. His boat is painted once every year in Petite Martinique at a cost of US $450.00.

Many operators paint their own boats at home or on the beach. Despite the fact that painting is done by the operators themselves, the costs associated with painting and fiber-glassing are still high, especially for those who use special marine paint. Painting is done throughout the Grenadines by craftsmen with Petite Martinique being one of the places where operators take their boats most frequently.

Many operators do not have insurance for their boats: liability or boat loss. This is due to the difficulty in getting insurance for wooden boats. Two operators do however have their boats insured. One is among the largest boats which has passed the inspections of the Grenada Port Authority. The premium is US $5000.00 each year. In addition he is required to pay XCD$275.00 in tax each year on his operation. These costs along with the other operation, maintenance and repair costs are proving to be burdensome given the low recent tourist arrivals in Carriacou.
4.2.2 Livelihood strategies

Livelihood strategies is the ‘the overarching term used to denote the range and combination of activities and choices that people make/undertake in order to achieve their livelihood goals’ (DFID, 1999: 23). In the Grenadines, complexity defines the livelihoods of WTops. They are involved in other livelihood activities that are both boat-related and otherwise (Figure 4-17). This complexity may be defined as livelihood multiplicity.

The relative importance of water taxiing as an income-earning activity varies among operators and may range from being a pastime to a means of survival. Its importance depends on the skills and other capital that individuals may possess. Of their income, the majority originates from business with visitors, ranging from 25% up to 100%. The average percentage of income earned from visitors was 70%, with locals accounting for approximately 20% and the sale and transport of goods for 10%.

* percent of total income

Figure 4.17 Livelihood activities of WTops

The sale of goods is important for some operators ranging from 5% to 60% of their income within water taxying. They not only supply yachts, but fishing boats from Martinique, hotels and restaurants with a variety of seafood, including lobster, red hind and snapper. Some operators set up vending points, for example on the beaches in the Tobago Cays which are manned by their spouses while they solicit sales from the yachts.
Water taxiing and fishing are often linked as income-earning activities, because the physical capital required for water taxiing and fishing are largely transferable. Fishers have said that they become involved in water taxiing because they can sell their catch to the yachts, restaurants, hotels and locals. The physical assets are largely, but not entirely transferable, therefore, many of the boats originally built for fishing are not properly equipped with emergency equipment and supplies and are not fit for passengers given their size. Like the fishers, many operators who do not depend solely on water taxiing, use their boats to supplement their income especially in the low season.

Locals and visitors are both important to WTops given the fact that business with visitors varies seasonally. In the tourist high season, operators may receive business up to seven days of the week as opposed to the slow low season when two days may be the maximum for a week. WTops need business from locals in the low season to sustain themselves, although many of them take this time to travel and some to seek more lucrative employment locally or overseas. The amount of business varies from season to season and between the earnings from locals and visitors. In many cases operators were unable to place monetary value on the income gained from each client group but estimated the percentages.

4.2.3 Vulnerability context

Natural disasters along with international events both have an impact on the livelihoods of the people of the Grenadines with the WTops being no exception. The major type of natural disaster affecting the WTops has been hurricanes, particularly given the lack of appropriate storage for boats during such events. International events and trends such September 11th and rising oil prices were also recognised by two operators in Carriacou as potential threats to the livelihoods of WTops.

Hurricanes are considered a major threat to the livelihoods of WTops especially in the wake of Hurricane Ivan in 2004 and Hurricane Emily in 2005, two significant hurricanes which affected the area in two consecutive hurricane seasons. A macro-socio-economic assessment was carried out for Grenada and although it was based on the fisheries sub sector, the results were applicable to water taxis considering that many WTops are fishers as well as the fact that the two groups utilise similar physical capital. The report highlighted that ‘the 2,200 fishermen in the sector lost engines, hulls, fishing gear, safety equipment, communicating facilities, and housing’. Damages were estimated at ECS$5,732,500 (OECS, 2004: 29).

Oil prices have been increasing globally, with an increase at the pump in Petite Martinique from US$3.00/gallon in September to US$4.50/gallon in October. WTops see the rising oil prices as an issue since their operation costs will also rise putting them further out of the reach of business with visitors and locals especially.

WTops believe that a fall in tourist arrivals would have a significant impact on the viability of their business as a whole. An operator stated that ‘the business has not been the same since September 11th, 2001’. He believes that ‘government needs to invest more in marketing the islands if WTops are to make a living from tourism’. He has invested in marketing on the internet for his business but this is not aggressive enough to lure visitors to the island.

Many WTops throughout the Grenadines and especially in the Southern Grenadines have indicated that when they offer a price to customers based on the price list they have established, their prices may be undercut by operators who are not members of the association. Those from
Union Island have noted that these operators approach their customers, offering lower prices resulting in them losing business. This has aggravated operators to the point of arguing openly in the presence of visitors, thus giving the impression of being unprofessional.

Since members of the association are also guilty of this, the issue has to be addressed at the level of the WTA, having established such a list. Some way of building unity and respect for each other must be devised in order that there can be fewer of these types of incidences. There must also be penalties for members who break the rules and regulations of the association.

A similar issue emerged from interviews with the operators from Carriacou and Petite Martinique. They have expressed concern over the varying prices to various locations not necessarily due to undercutting of prices but as a result of varying sizes of engines and the number of engines on the boats which determines the amount of money an operator must spend on fuel. The fact that operators do not all work from the same location also contributes to the variation in prices.

5 DISCUSSION AND CONCLUSIONS

Through recent studies, the livelihoods approach has recognised that diversity of livelihoods strategies may occur at various levels; over geographic areas, across sectors, within households and over time (DFID, 1999). This study of WTops in the Grenadines lends support to these findings with operators being involved in multiple livelihood activities. The combination of activities at various times throughout the year has been adopted by 80% of the operators to meet their needs. This ‘livelihood diversification’ has been identified as a characteristic of the socio-cultural fabric of the Caribbean. It has been used by WTops probably to reduce their vulnerability so that they can continue to earn a living when one livelihood option is no longer viable (McConney et al, 2003). Livelihood diversity as a strategy should not be discouraged given the seasonality of their income which is mostly derived from tourism. It is a coping strategy used to reduce uncertainty which allows operators to take advantage of a wide range of opportunities.

WTops are stakeholders who are involved in a number of activities also related to the coastal resources. They therefore have the potential to play a role in the co-management of coastal resources given their dependence on these resources for their natural capital as WTops and other livelihood activities. Their development has been undertaken by the WTP which seeks to raise awareness with regards to the everyday practices of the operators which impact negatively on the environment. The project seeks also to mould WTops into responsible stakeholders who are able to see the benefits of protecting and caring for their environment while continuing to make a living. The possibilities for such an arrangement may be a consideration for the Grenada which is seeking to develop marine protected areas (MPAs) in its Grenadine islands.

Operators from the southern Grenadines and Carriacou and Petite Martinique identified the varying prices as an ongoing issue throughout the Grenadines. A solution to this issue is difficult given the various factors that contribute to varying prices. One solution may be to regulate the size of boats and have a graded scale of prices with respect to the size of the boat or size of the engine. Another might be to have a price on the value of the experience to the various sites (valuation) with the additional cost being for the price of gas, level of comfort provided and the time spent at the site. This would result in the need for promotion of one’s business and may be advertised by the tourist board in the particular island. Overall however there needs to be an
economic analysis of the WTOPs since their operational and maintenance expenses appear at times to exceed their receipts, which are unpredictable.

WTOPs may address costs by conserving on fuel through various measures both on and off the water (Box 5.1). These fuel-saving measures relate to engine and boat maintenance as well as consideration of the weight on board the boat (Squires, 2001).

### Box 5.1 Fuel-saving options for WTOPs

#### MAINTENANCE
- Keep your engine well tuned. Be familiar with the number of hours that your engine should run before it requires a major overhaul.
- Ensure that your propeller is right for your boat and repair or replace it if it's damaged. According to a propeller specialist, Ray Curtis, propeller specialist from Temple Hills, MD, "if you don't have the right propeller for your boat, it doesn't matter how well your engine runs -- you'll be spending lots more money for gas." It is also therefore important to ensure that you have the right match for your engine and there are no misalignments or dents to slow it down.
- Install a fuel-flow, if you have a large engine. This monitors consumption, showing not only how much fuel you've used but how fast you're using it, helps you find your most efficient cruising rpms, suggests Annapolis, MD marine engine expert Karl Allen. Installing trim tabs on a planing hull can also improve fuel consumption, he said.
- Use the right antifouling paint and keep your bottom clean. Even a slightly dirty bottom can keep your boat from planing or, on a displacement hull, can slow it down dramatically.

#### ON THE WATER
- Carry less weight on board. It is not necessary to fill all fuel tanks to the brim.
- Do not overload your boat with people, coolers or other gear, and distribute weight evenly.

Source: Adapted from B. Squires, 2001.

The President of the CPMWTA is also concerned about other aspects of ‘free lancers’ who are neither part of the association nor very serious about water taxiing. ‘They harass tourists and dispose of garbage poorly while overcharging for the service’, he said. This issue was raised also by an operator from Union Island who witnessed operators taking garbage from yachts, charging for the service and quickly disposing of it overboard when they believe that they are out of sight. He said that he was the target of vandalism by these ‘free lancers’ because he has developed a relationship with various yachting companies which precludes others from benefiting from the yachts visiting the Chatham Bay area.

There is very little that can be done to curb indiscriminant garbage disposal except intervention from government and education that leads to peer pressure and community sanctions. Improved surveillance of the entire Grenadines area is one option that would have to be approached by the government. One operator suggested that the penalties are not tough enough to deter the delinquent operators.
Disrespect of visitors is another issue that was raised by many operators. Problems arise when visitors are approached by operators and they decline their services. It is alleged that abusive language is sometimes directed toward visitors and the offenders may even become violent, using weapons. An operator lamented that he has been called by customers that he has taken to various sites with complaints that they were being harassed. There is also difficulty in identifying the perpetrators.

An approach to this problem lies in the establishment of a fully functional WTA with registration numbers placed prominently on the boats for easy identification. This allows for easier tracing of the offender if he belongs to an association. The two associations are at different stages in this process but it is an important aspect that needs to be implemented.

Training for operators in customer service and conflict management has been recognised by the water taxi project as an important development activity. Training in life-saving should also be a priority if operators are to be considered proficient.

The water taxi project can contribute to the enhancement of livelihoods of WTops through capacity building activities. There are some areas however which require awareness education, training and further research. These include:

- A full sustainable livelihoods study to address the areas omitted in this study
- Educational awareness of the impacts of poor garbage disposal on the health of marine organisms and the marine environment to improve the human and natural capital of the operators:
  - Training in life-saving so as to improve the proficiency of operators,
  - Training to foster mutual respect and trust among operators so as to reduce conflicts among operators,
- An economic study to determine the viability of water taxiing,
- A Knowledge-Attitude-Perception (KAP) study at the end of the project to determine the impact of the WTP

Most WTops are eager to learn how to improve their livelihoods. Many however lack the financial capital to do much of the improvements that are necessary while some are limited by their educational backgrounds. In order to address the needs of WTops in a way that is most effective a practical approach should be adopted in the execution of the WTP.

It has been recognised that multiple livelihood activities is a coping strategy that operators adopt to protect themselves from vulnerability. Training should therefore not only be applicable to water taxiing but to developing all aspects of the water taxi operator. There is the need for the development of other skills so that WTops can pursue other livelihood activities in the low tourist season. This may contribute to improving the lives of operators through increasing income which has spin-off benefits.

Preliminary Survey of Water Taxi Operators

Purpose of Questionnaire: To establish a database of water taxi operators throughout the Grenadines for the Sustainable Grenadines Project. It will also provide a basis for selecting a sample size for the in-depth survey to be carried out on the livelihoods and green boat practices of water taxi operators.

Surveyor Name:__________________________  Date:________________
Respondent #:__________________________

1. Name of Boat:__________________________
2. Registration Number:___________________
3. (a) Name of Owner:___________________
   (b) □ Male      □ Female
4. (a) If name of boat operator is different from the owner of the boat, please provide the name of the person:______________________________________.
   □ Male      □ Female
5. How many persons operate this water taxi? ____________________.
6. Name and sex of Operator/s:
   Name:__________________________  Sex:__________________________
   Name:__________________________  Sex:__________________________
7. Length of Boat:__________________________.
8. Type of Boat:__________________________.
9. Where do you dock your boat?__________________________.
10. Are you a member of a Water Taxi Association (WTA)?
    □ Yes      □ No
11. Which WTA?__________________________.
12. Number of Engines:__________________.
13. Type of Engine:______________________.
14. Horse Power: ________ and ________.

We will be conducting two in-depth surveys in approximately two weeks on your livelihoods and your boating practices. We would therefore appreciate if we could interview you again at your convenience.
Appendix 2: In-depth survey of the livelihoods of water taxi operators in the Grenadines

Water Taxi Livelihoods Analysis

This questionnaire inquires about the livelihoods of water taxi operators in six Grenadine Islands: their livelihood assets and strategies as well as their vulnerability. It is a baseline study for the Water Taxi Project under the Sustainable Grenadines Project as well as a contribution to my research paper.
